

# Heart Disease Analysis Project

## **Prepared by:**

Md Shamim Ahmed

Roll: 09-006-21

Batch 06

Course Name: Data Science with Python

## **Instructor:**

Md. Rashid Al Asif

Assistant Professor ,Department of CSE

University of Barishal

## ► **Objective**

- Analyze the heart.csv dataset to uncover patterns in heart disease data.
- Develop a predictive logistic regression model for heart disease classification.

- ▶ **Dataset Overview**
  - ▶ **Key Features:** Age, Cholesterol, Chest Pain Type, Blood Pressure, etc.
  - ▶ **Target:** Heart disease presence (1 = Yes, 0 = No).
- 
- A series of several parallel white diagonal lines of varying lengths, located in the bottom right corner of the slide, extending from the right edge towards the center.

- ▶ **Key Findings**

- ▶ **Significant Predictors:**

- ▶ Age, Chest Pain Type, Maximum Heart Rate.
- ▶ Exercise-induced Angina positively correlated.

- ▶ **Model Accuracy:** 84%.

## ▶ **Methodology**

- ▶ Data Cleaning & EDA.
  - ▶ Visualization: Correlation Heatmaps, Age Distribution, etc.
  - ▶ Logistic Regression: Simple, interpretable model.
  - ▶ Evaluation: Accuracy, Precision, Recall.
- 
- Several white lines of varying lengths and slopes are positioned in the bottom right corner of the slide, creating a modern, abstract graphic element.

## ▶ **Future Work**

- ▶ Test advanced models (e.g., Random Forest, Neural Networks).
  - ▶ Integrate more features (e.g., lifestyle data).
  - ▶ Validate on external datasets for generalizability.
- 
- A series of several parallel white diagonal lines of varying lengths, located in the bottom right corner of the slide, extending from the bottom edge towards the right edge.
